

Who We Are

We are former CoCreate - HP employees, each with 20 years of experience with the product line. Indeed no one has more knowledge or experience working with it than we do, since we are its original developers. We believe in the products, and want to ensure users have continued access to us and our knowledge. We started our careers designing with CAD, and understand that people want the tools to adapt to their way of doing things, not vice versa.

We find these tools to be very flexible, highly configurable and customizable. Through years of providing solutions to many customers, we have developed a core foundation of knowledge, skills and reusable code to leverage in most any project. We enjoy talking with customers about their particular experience, and finding ways to help them harness the products to much greater advantage. Contact us about your organization's needs!

CADM Products and Services

➤ *What we can do for you*

We specialize in the CoCreate product line as our sole business. From configuration to training to full customizations we keep customers' systems current and running smoothly.

Machine designed using Modeling

➤ CADM, Inc

Providing Solutions for the Creo Elements/Direct product line

Our Services

We are highly committed to these products.

Training In addition to PTC offerings, we deliver our own courses including Advanced Surfacing, Integration Kit training, and customized courses. We offer video-based, self-paced training materials. We also provide on-site instructors with product expertise and practical experience in the field.

Customization We build custom extensions to all the products: Modeling, Drafting, and Model Manager. These product customizations target areas needed to meet your business objectives.

Consulting: We will come to your site and help evaluate where improvements can be made to the processes and tools to make them more efficient.

Enhancements: We develop customer-driven enhancements to the products' functionality. Recent examples include:

- ◆PCB Module enhancements which improved performance by over 20x
- ◆Constructing and populating enhanced pdf forms automatically upon project-stage completion
- ◆Intuitive replacement of the Machining Module functionality with a simple and intelligent hole wizard interface

Application Development We develop complete new applications built upon platforms. Examples for Modeling include:

- ◆Ray Trace module which calculates the path a beam of light may follow. Useful for applications using lasers or light tubes.
- ◆Autorouting tool for complex cables, maintaining proper spacing and clearance from 3D obstructions. (image below)

Bug fixing: In many cases, we can fix existing defects without requiring a code modification. System administrators can thus install the add-ons. We make these fixes available to PTC to integrate into the code when possible.

Data Migration and Configuration Management: We specialize in data migration in and out of Model Manager, Modeling, and Drafting. Configuration Management can range from creating rules governing how revisions are managed, to triggering complex actions when key events take place in the product life cycle.
